Seedling Survival Survey Summary – Enrichment Planting 2025

Khok Pa Rang Community Forest Committee, Phanna Nikhom District, Sakon Nakhon · Ref. KPR-SV-2026-03 · Issued 18 September 2026

1. Purpose and survey details

This summary reports the first-year survival count for the Khok Pa Rang Enrichment Planting 2025, in which 3,600 native seedlings were planted in three plots between 12 and 20 July 2025. The count was carried out from 8 to 10 September 2026 by nine village volunteers and four Grade 11 students, led by Survey Lead Anchalee Boonrueang.

2. Results by plot

- **Plot A – Upper Ridge:** 1,400 planted, 1,078 surviving (77 %).
- **Plot B – Stream Bank:** 1,200 planted, 588 surviving (49 %). Of the 612 dead seedlings, 430 were recorded as killed by the stream overflow of 19–24 August 2026, when water stood on the plot for six days.
- **Plot C – Old Cassava Field:** 1,000 planted, 710 surviving (71 %). Around 150 seedlings were browsed or trampled by cattle before the bamboo fence was finished on 2 October 2025.

By species, Makha Mong did best across all plots, followed by Yang Na. Pradu had the weakest survival on dry ground.

3. Replanting rule applied

Under the resolution of the general meeting of 22 March 2026, any plot with first-year survival below 60 % is replanted in the next rainy season. Until that meeting the threshold was 50 %. Plots A and C are above the threshold and will receive only gap filling by volunteers, limited to 100 seedlings per plot.

Exception. Where more than half of a plot's dead seedlings were killed by flooding, replanting is postponed by one year so that the planting layout can be redesigned, and only flood-tolerant species may be used. The redesign must be approved by the committee chair before any seedlings are ordered.

4. Actions and next steps

- Committee Chair Kittisak Phonsawan will review the Plot B redesign at the committee meeting on 12 December 2026.
- Volunteers will repair the Plot C fence by 31 October 2026.
- Gap filling in Plots A and C is scheduled for the first two weekends of June 2027.
- The dry-season check, which records water stress and fire damage, will take place on 15 March 2027. The full second-year count is planned for September 2027.
